Issues with Ensemble v2017.1 and DH key-length on https server

Hi,

I am facing an issue after upgrading from Ensemble version 2015.1 to 2017.1. On 2015.1, I was testing a Rest operation using a https mock-server. But now on 2017.1, the same Rest operation throws me the following exception on testing...

'ERROR #6085: Unable to write to socket with SSL/TLS configuration 'configSslClient.lsgDefault', error reported 'SSL/TLS error in SSL_connect(), SSL_ERROR_SSL: protocol error, error:14082174:SSL routines:ssl3_checkcert_and_algorithm:dh key too small'.

I don't want to make any change on the https server.

Is there any configuration-change available on v2017.1 to make Ensemble accept the small DH paramater (which it is complaining about)?

Thanks in advance,
Khalid
