SQL Query for Range

Hello,

I have a question related to running an SQL query for range of data.

I am running a query like:

```
Select A,B from table_name where A>=12345 AND A<=12390
```

- Where A and B are my two of the properties under the mentioned table/class definition

- A is an integer property

Question: The result of the above query does not return me all the values between the mentioned range of integer though I do have all the values in that range. I see that some of the values are missing in result.

Any reason why this query won't work?

Any ideas?

Thanks,
Aditi
