Localization of DeepSee Pivots

How can I localize arbitrary column name in DeepSee pivot?

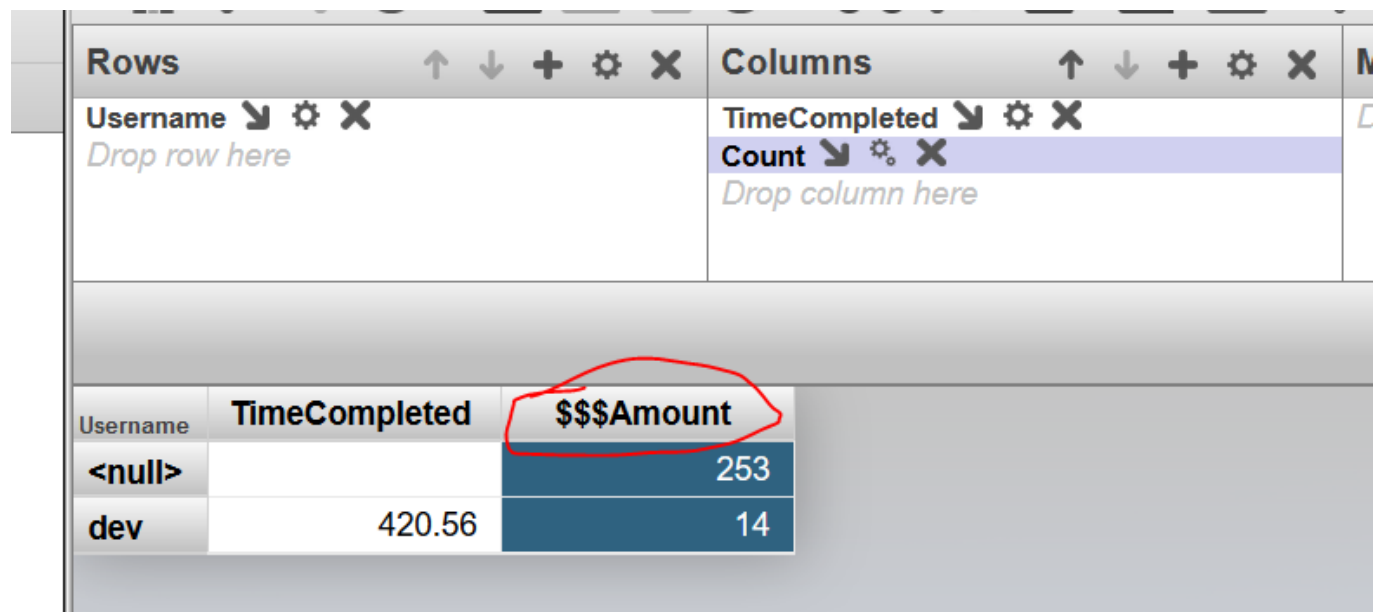

If a column name is a dimension or a measure I can localize using architect following [this guide](#).

But what about some random string?

I have tried setting:

- Value
- \$\$\$Value
- \$\$\$Value/MYDOMAIN

as a Caption, but every option simply displays as is.

Rows			Columns		
Username			TimeCompleted		
Drop row here			Count		
			Drop column here		
Username	TimeCompleted	\$\$\$Amount			
<null>		253			
dev	420.56	14			

Строки		Колонки	
Имя пользователя ⌵ ⚙ ✕ <i>Перетащите строку сюда</i>		Время выполнения ⌵ ⚙ ✕ Count ⌵ ⚙ ✕ <i>Перетащите ячейку сюда</i>	
Имя пользователя	Время выполнения	Amount	
<null>		253	
dev	420.56	14
