dotenv: Read environment variables from a .dotenv or straight from your OS

You might find it useful or not. It depends on what you can imagine it to be used with, like I had to.

Either way, I created a lib that can fetch environment variables from a file or from the OS where Caché is running.

Mostly known as [dotenv](#). Many languages have it, so why not Caché?

The usage is pretty simple:

If you want to use OS env vars exclusively, just use the method:

```
##class(DotEnv.Parser).FromOS()
```

Otherwise, if you want to specify a .env file containing your variables to complement the OS ones use the method:

```
##class(DotEnv.Parser).FromPath("/path/to/file")
```

Both methods return an %ArrayOfDataTypes containing the env variables.
