Is there a way to map a \$lb() to its data model ?

Hi all,

We faced a problem where we would like to map a \$lb object to its corresponding data model structure in order to later on export it as JSON.

So imagin that we have something like this that actually maps to a persistent table with its structure.

```
$lb( " " , , , , , " " , , , "BOOLEAN" , "0" , 2 , 2 , "1" , , "bla" , $lb( , , "bla" , "20050502123400" ) , " " , 1 , "bla" , , 0 )
```

Is there a way to transform this \$lb (without the need of openig the object itself) to a JSON object with the proper table fields as properties?

Many thanks
