Ens.StreamContainer

Hi All,

I am fairly new to Ensemble and I wanted to know I have inbound business
service (EnsLib.File.PassthroughService) which is looking for pdf files once it finds a pdf file (within the business
process) it needs to find the associated xml file which would be in the same directory. Once both of these files are
found they need to be sent to the business operation and deleted from
the source (EnsLib.File.PassthroughOperation). My issue is that when I am looking for the xml file and I want to
send it to the business operation I get the error that there is no stream within the streamcontainer. I am assuming
that I need to read the xml file as a streamcontainer object and assign it to a context property, which will then be
sent as the request to the business operation but I am unsure how I can achieve this. Any help or code snippets
would be great.

Kind Regards,

Salma
