Ensemble passthrough configuration

I have tried to create Ensemble SOAP passthrough operation following [this guide](#).

Here's my production configuration (after steps 1-4):

```
Class Passthrough.Production Extends Ens.Production
{

XData ProductionDefinition
{
<Production Name="Passthrough.Production" LogGeneralTraceEvents="false">
  <Description></Description>
  <ActorPoolSize>2</ActorPoolSize>
  <Item Name="PassthroughOperation" Category="" ClassName=
"EnsLib.SOAP.GenericOperation" PoolSize="1" Enabled="true" Foreground=
"false" Comment="" LogTraceEvents="false" Schedule="">
    <Setting Target="Adapter" Name="HTTPServer">www.webservicex.net</Setting>
    <Setting Target="Adapter" Name="URL">|</Setting>
  </Item>
  <Item Name="PassthroughService" Category="" ClassName=
"EnsLib.SOAP.GenericService" PoolSize="0" Enabled="true" Foreground="false"
Comment="" LogTraceEvents="false" Schedule="">
    <Setting Target="Host" Name="TargetConfigName">PassthroughOperation</Setting>
    <Setting Target="Adapter" Name="EnableStandardRequests">1</Setting>
    <Setting Target="Adapter" Name="Port"></Setting>
  </Item>
</Production>
}
```

Step 5 of the guide says to open the url:

<http://localhost:nnnnn/currencyconverter/ConvertCurrencySOAPPassthroughS...>

have two web applications in a namespace:

- /csp/passthrough
- /passthrough

I have tried calling the following urls:

- <http://localhost:57773/passthrough/PassthroughService/CurrencyConvertor.aspx>
- <http://localhost:57773/passthrough/PassthroughService/CurrencyConvertor.aspx?CfgItem=PassthroughService>
- <http://localhost:57773/csp/passthrough/PassthroughService/CurrencyConvertor.aspx>
- <http://localhost:57773/csp/passthrough/PassthroughService>

/CurrencyConvertor.aspx?CfgItem=**PassthroughService**

Yet, I get 404 error. Direct calls to a remote service are successful. How do I call my passthrough service?
