Update an Item Setting Value in studio ?

Hello everyone .

I am trying to update a setting of an operation directly via the code of a business operation.

Concretely, my customer want a counter for the number of calls to the operation and the possibility to redefine the point of this counter.

I was thinking of something like:

```
set counter = <getSettingValue("Count")>
...
set counter = counter +1
do <setSettingValue("Count")> = counter
```

In other words, after each call, the parameter will be incremented, but if the user want to redefine it between 2 calls, he can and it will be took into account.

My parameter is present in my production class , this is the value '2000' that i would like to increment :

```
⊞ <Item Name="CosTutorial.testIncrementalParameter" Category="" ClassName="CosTutorial.testIncrementalParameter"
  <Setting Target="Host" Name="Count">2000</Setting>
</Item>
```

My question is : Is there any method to do this ?

I'm using Caché Studio 2014.1.4 on Windows .

Thank you.

Regards
