## \$Order and \$Next in Cache Basic script

Hi all,

I need to create a routine to modify some values in a global.

My first attempt was:

```
// Search the first position of Messages
set pos=$Order(^Ens.MessageBodyD(""))
while(pos > 0){
  // Get the class name
  set clase = $Order(^Ens.MessageBodyD(pos,1))
  if (clase="MensajesRestResponse")
  {
    // Do the conversion
  }
  set pos = $Next(^Ens.MessageBodyD(pos))
}
```

but if I use a \*.bas file (cache basic script), I'm not able to use these commands (\$Order and \$Next) and I don't know how to translate theses words.

please, could the community help me?

My goal is convert the content of the message (old messages) from %String to %Stream.GlobalCharacter because now there are some values in string and other are on Stream.GloablCharacter and there is not match in ^Ens.MessageBodyS for these messages.

Best regards,

Francisco Lopez
