pButtons: WDphase - Phase of the Write Daemon- 8: Databases are being updated. What does it mean?

```
Caché Version String: Cache for UNIX (Red Hat Enterprise Linux for x86-64) 2016.2.1
```

We have a mirrored Ensemble system (110, backup and 210, primary). At one time (14:00) there is a disruption in the production. The messages are not being processed.

and the backup

The different values of WDphase are:

0: Idle (WD is not running)

5: WD is updating the Write Image Journal (WIJ) file.

7: WD is committing WIJ and Journal.

8: Databases are being updated.

Can anyone explain what the different phase of the write daemon mean, and what can be the cause that the backup site of the mirror keeps giving the WD phase 8.

PS

We have looked at the storage on server 110. We did not see any thing.
