Release Candidate of Caché and Ensemble 2017.2

I am pleased to announce that Release Candidates of Caché and Ensemble 2017.2 are now available.

Many customers have already downloaded the Field Test over the past few months, and we appreciate your feedback.

This release contains significant improvements, including:

- Parallel dejournaling to improve throughput of mirroring and journal restore.
- New iFind and iKnow features like co-occurrence search, performance improvements, and more.
- SQL enhancements in Query Auditing, optional ANSI SQL operator precedence, and Frozen Plan Evolution, along with our normal cast of query optimization improvements.
- Ensemble updates include DICOM enhancements, XML performance, and XSLT2 activities in BPL.

You can get details of these improvements from the Release Notes, which can be downloaded from the Developer Download page link below.

Over 340 additions and corrections have been made since the beginning of Field Test. If you haven't looked at it recently, I encourage you to do so now.

You can download the latest release candidate version of 2017.2 [HERE](#).

We anticipate Final Release to be available by October of 2017.

We welcome all your comments, questions, and feedback.
