Are there server-side Git Studio Hooks available out there?

I want to demonstrate using Git via Server-side Source Control hooks (to allow both Studio and Atelier to access a Shared Dev namespace), and I was planning to use the popular Caché Git hooks:

<https://github.com/intersystems/cache-tort-git>

Unfortunately, when I installed and configured them I realized that they will not work in a Shared Dev configuration because those hooks rely on calling the TortoiseGit Windows executable, which means that your IDE and your Caché instance must both be running on the same machine (this doesn't make sense for Shared Dev configurations).

Can anyone point me to examples of Git hooks for Studio which do not rely on calling a UI executable, but rather rely on the CLI for Git so they can run on a different machine than the IDE?

Thanks in advance for any suggestions you can offer.

Ben
