Two measures cannot be cross joined

Hello, I've completed this tutorial: <https://community.intersystems.com/post/deepsee-period-date-vs-same-peri...>

I've used the "year" level instead of a pivot variable.

I want to calculate something like the following variation: $100 * ([DateOfSale].[PTD] - [DateOfSale].[LYPTD]) / [DateOfSale].[LYPTD]$

I create a new calculated member, under the same dimension with the above expression.

I put the new calculated member under the Count measure and it tells me that "Two measures cannot be crossjoined"

What am I doing wrong?

Can you redirect me to some explanations and maybe a solution?

Thanks!
