What is The Best Backup Strategy For a Small-sized Database in Caché?

Hi, folks!

What could be the best backup/restore strategy for a small (less than 100MB) but very valuable database which is placed on AWS/DO virtual host?

1. Use AWS/DO backup/restore features?

2. External backup [(as the most recommended)](#)?

3. InterSystems backup?

4. Globals export to a zipped file?

5. cache.dat copy?

Looking for the most robust and easy to use/implement method of backup and restore in a way "setup and forget" (until it becomes needed :)
