Troubleshooting Ens.Email.AlertOperation...ERROR 6070: SMTP Send failed

Should be easy, right? My DEV environment is working just find and sending out alerts via email, however my TST and PRD environments are showing "ERROR #6070: SMTP Send failed" on the Ens.Alert email operation. Same configuration settings on the operation, same SMTP server being addressed (I confirmed that I can ping the mail server from DEV, TST, and PRD boxes) and same port#. I turned on "Log Trace Events" but don't see anything additional in the logs. Am I missing something?

Let me know if you have any thoughts.

Thanks,

Hunter
