Is is possible to configure Visual Trace to only show specific services,processes and operation

We have a large number of processes and operations being applied to outbound HL7 messages from our PAS.

If I select a message, and open its visual trace, I see the service, as well as all processes, and operations.

My debugging is often about a new operation, and I don't need to see all the other operations that are in functioning as desired.

Is is possible to configure Visual Trace to only show specific services,processes and operation? Or is is possible to see a trace from the perspective of a particular operation, showing only (service,process&Operation) columns in the trace that pertain to that operation, or the resulting message?

Kind Regards,

Stephen
