CSP: Print All PDF Reports, Java Applet not Supported Anymore, How to Migrate to Java Web Start (JNLP)

Hi all-

We used to have this Java applet in our CSP page to "print all" and "download all" PDF medical reports. We want this applet so that the user won't have to open each PDF in the browser just to print it.

But now most browsers do not support Java applets anymore due to security concerns, so that Java application is down. We tried to migrate to Java Web Start but don't know how to invoke the JNLP file from the CSP page. I am new to Cache so any help would be greatly appreciated.

Also, is there an easier solution to this print all problem? I assume many hospitals/labs would be facing the same issue, so there might be a smart hack?
