Crypt-compatible COS function/implementation - has anyone seen this code?

Hello,

I am looking for ObjectScript implementation of crypt-compatible function, that generates md5 salted hashes (output is in the form of \$1\$salt\$hash). From what I understand it uses its own spin on md5 algorithm:

[https://en.wikipedia.org/wiki/Crypt\(C\)](https://en.wikipedia.org/wiki/Crypt(C))
<http://php.net/manual/en/function.crypt.php>
<http://www.gnu.org/software/libc/manual/htmlnode/crypt.html>

Does Cache have something like that built in?

Has somebody here seen it implemented somewhere?

Thanks.

Added:

I have found description of the underlying algorithm here: <https://www.vidarholen.net/contents/blog/?p=32>
