# Export macro in "Export for production"

Hi all,

According to the post [How to Export and Import Ensemble Components and Productions](#) we can create a unique file to implement and deploy a production, but I'm not able to export and import macro file in the process.

I've been looking for how to implement the macro file in this process but I haven't found anything.

is it possible to export and deploy the macro file in the "Export from Production"?

The screenshot shows the 'Export From Production' dialog box. The title bar says 'Export From Production' and 'Category: All'. The main area has a header with the InterSystems logo and 'Export From Production Common.Produccion'. Below this, there's a section for 'Production: Common.Produccion' with fields for 'Namespace: COMMON', 'Instance HEALTHSHARE', 'Machine: [redacted]', and 'User: [redacted]'. To the right of these fields is an 'Export Notes:' text area. Below the production information is a section 'Add to package:' with a grid of buttons: 'Config. Item Definition', 'Business Service Class', 'Business Process Class', 'Business Operation Class', 'Message Class', 'Rule Definition Class', 'Data Transformation Class', 'VDoc Schema Category', 'Lookup Table', 'Dashboards', 'Class', 'Studio Project Files', 'Production Settings', and 'Deployable Settings'. Below this is a 'Manually Added:' section with three checked items: '[cls] Common.Utills.Encriptar', '[cls] Common.Utills.JSON', and '[cls] Common.Utills.Utilidades'. Below that is a 'Production:' section with one checked item: '[cls] Common.Produccion (Production Class)'. At the bottom, there are buttons for 'Select All', 'Unselect All', 'Cancel', and 'Export'.

Best regards,

Francisco Lopez
