\$CASE or \$SELECT Analog in Cache´SQL

Hi, folks!

Is there any way to use \$CASE or \$SELECT functionality in SQL SELECT query?

E.g. something like this:

```
SELECT product, $CASE(status,"New":field1,"Payed":field2) as data from sales
```

To see either in data column either field1 or field2 values in regard of status value.

[#SQL](#) [#Cache](#)
