# FTP2FTP transfer without storing information into database?

Hello!
We want an Integration that should be moving files from a FTP server in a DMZ zone into another FTP server on our local network.
I tried using EnsLib.FTP.PassthroughService(EnsLib.FTP.InboundAdapter, EnsLib.FTP.OutboundAdapter)
Using this approach ensamble write data to the database, causing the CACHE.DAT to grow for every file that is moved.
Looks like the entire file is written to the database, is this the case?
We are not really interested in storing any file content information in ensamble in this particular case.
Does anyone has a good suggestion on how to accomplish the file transfer using ensamble with another approach/configuration or arguments on why this would be a bad idea in the first place?
Best regards,
Magnus
