Multiple joins in a SQL query

Hi,

I have a query like below but its syntax is not accepted by Cache.

I would like to perform a left join on two tables first and then make a inner for this result with another table.

Given the constraint that we only allow one SELECT in the query, it is possible to achieve this semantics ?

Thank for your help.

```
Select *  
FROM ( sample . employee e  
LEFT JOIN sample . company c  
on c . id = e . id ) g  
JOIN sample . vendor v  
on v . %id = g . attr
```
