## How can I see serverside and webpage output while developing on the Atelier 1.1 plugging platform?

"Help me, Obi Wan Kenobi"?

I ' ve hit the wall. I ' m a one person shop who wants to start developing Cache on a mac using Eclipse/Atelier, after using Studio for the last 5 years. I ' ve installed the 1.1 beta plugin, watched 6 or 7 videos from the September conference, tried several times to work through the cheat sheets, only to have connection issues or compilation issues, so at this point, I ' m feeling very frustrated. The videos were interesting, but generally didn ' t work as tutorials for fundamental programming operations, for me.

I feel comfortable with Objectscript and Zen development in Studio. What I need are step by step Atelier instructions, such as have been offered in previous excellent Cache tutorials to:

1. Run compiled Cache class and routine serverside code and see its output on a Terminal equivalent.
2. Run compiled CSP/Zen code and see its output to a web browser.

Where a plugin is needed, would you recommend which plugins are closest to Studio in functionality? (Also, any recommendations for Objectscript plugins?) I would guess you want to be agnostic, but I would think suggesting plugins that work most similarly to Studio...should be okay?

I can see many good reasons for InterSystems to switch to Eclipse, but I see no reason for there to be no way to see what the completed class code should look like at the end of each cheat sheet. You could even do a quick and dirty video of someone going through the cheat sheets in a true step by step manner. I suspect it could be done in 45 minutes using mac ' s QuickTime screen recording app.

Any thoughts?

Thanks.

Best,

Bob Harris
