## Better strategic. Business process with pool size = 4 or 4 business process

Hello,

I want to process more requests per second in Ensemble 2015 (soap service). My problem is in a business process that makes a great transformation. I thought that I can put its group size to 4 (the current value is 1), or put 4 business processes and apply, for example, the round-robin algorithm.  
Which alternative is better?

[#Ensemble](#) [#Business Process \(BPL\)](#) [#Performance](#)
