ECP Connectivity

Hi All,

Background: I have my data in Globals on a Cache instance A and I SQL projected(Added SQL Storage) all my globals as Classes to do SQL Operation.

I am about to start writing my application code in Ensemble(Planning to use Business Service, process and Operation) , Now I wanted to do ECP connection between Ensemble instance and Cache instance to get data from Cache.

Questions

How to do ECP connection between two instances?

Does SQL projection of classes is really required or I can use the globals from Cache server.

Can anyone please share the link to learn the basics of ECP connection.
