Find last in a list of objects

I have a class to track data changes.

As it becomes slower and slower to find last changes I think I need an index.

The 2 classes are just simplified reality.

HowTo ?

Class Rick.ChangelItem Extends %SerialObject

```
{  
Property Subject As %String;
```

```
Property Author As %String;
```

```
Property Change As %TimeStamp;  
}
```

and

Class DC.listItem Extends (%Persistent)

```
{  
Property Title As %String;
```

```
Property Changes As List Of Rick.ChangelItem ;
```

```
/// where & how create the index ?
```

```
}
```
