How to save a PNG image in Cache, from a base64 data string

Hi,

Is it possible to Save a base64 data string, representing a png, as a binary png file, In Cache?

When I search google , in general , not Cache specifically, I see such articles:

<https://stackoverflow.com/questions/11511511/how-to-save-a-png-image-ser...>

and this answer:

You need to extract the base64 image data from that string, decode it and then you can save it to disk, you don't need GD since it already is a png.

But I don't know how to implement that in Cache.

Regards,

Nael
