Retrieving REST Data

I'm sending data via ajax to my REST service, and while retrieving any information sent in the url parameter is easy when they're defined in the route, I can't get anything if I store information in the data parameter. For example:

```
$.ajax({  
    url: "ServerURL",  
    data: { "some": "json" } //How do I get this information?  
  
    ...  
})
```

I've looked at many common solutions such as here:

<https://community.intersystems.com/post/lets-write-angular-1x-app-cach%C3%A9-rest-backend-part-9>

However, %request seems empty for the most part. I can get the url of the request and the method type, but Data, Content, Content.Read(), etc. are always empty. I feel like something simple is missing here that I'm not seeing. Any help is appreciated!

Thanks,

David
