## CSP interaction with javascript var

Developers,

I am working with a CSP page with among other fields a checkbox.

Based on the checkbox I want to populate a drop-down box with specific options with a server side method using &html<....>.

I have the status of the checkbox in a javascript var.

Can I access this var or maybe the checkbox setting in the server side method?

Basically how do I know the status of the checkbox to populate the drop-down box correctly?

Any suggestions are appreciated!

Jacques
