Filters in DeepSee Dashboards

Hi Community, I have a dashboard with 4 widgets, two of them use the same filter date and the others two another filter date. I want to know if it's possible that when I selected a date in one widget affected also the other widget with the same date. I saw that the filter can affect all of the widgets or only one, the owner of the filter. The other thing that the client ask me, if exists the possibility to create a generic date and when the user choose the range of date, will affect all of the widgets, independent that are different dates. If it's possibly, the only way , i think, it's trough KPI
Thanks for your help
