Hiding/re-writing URL content

Hi,

There have been similar questions asked before, but a few years ago now. My problem is that when I create an application in plain CSP, a typical link to a page will look like this in the browser..

<https://omnidata.com.au/csp/lcda/StudentList.csp?CSPCHD=001000010000EYnm...>

One user sent back a comment.. 'I'm not using your application as it is un-secure' .. based on the fact that the elements are spelled out in the URL.

Is there now some way of hiding the path and the .csp page in the URL?

Thanks in advance,

Rosti.
