Creating a domain programmatically and language setting

I am trying to create an iKnow domain programmatically like:

```
Set dom = ##class(%iKnow.Domain).%New("TestDom")
Do dom.SetParameter("DefaultConfig", "MyConfiguration")
Set sc = dom.%Save()
```

...

Although "MyConfiguration" sets the language to "ja", i.e. Japanese, it doesn't seem to be respected, and what I see on the top right pane in Knowledge Portal is related concepts, instead of proximity profiles, which I expect to see in Japanese language mode.

Also resulting segmentation of sentences looks to be it is in English mode.

Can someone tell me how I can do this?
