What Are You Using For Issue Tracking?

Hi, Community!

What is your favorite issue tracking system for projects with InterSystems Data Platform? What did you use and what are you using now?

In projects with InterSystems Data Platform, I worked with [Redmine](#), JIRA, Trello. A lot of code versioning systems now have this feature too ([Gitlab](#), [Github](#)).

Now my favorite for small and medium projects is Github, because it is simple, is very close to code (commit-issue linkage) and it has kanban).

E.g. see the DC public [GitHub project](#) (and add your [issue request](#) ;)

What is your choice?
