Validate against schema programatically

Hello,

I am running a transformDTL through COS that transforms an EDI document to JSON and would like to validate the document and throw an error if it does not validate or build a map.

I am looking at available methods and haven't been able to find one that sort of does: Set tSC = ##class(*).Validate(tDoc,"HIPAA5100").

Any help here would be appreciated, it seems like I am missing something simple.
