Permissions Change on 2017.2 vs 2017.1 When Shutting Down?

We upgraded from 2017.1 to 2017.2 today and noticed that when shutting down we must do it as an administrator. Attempting to shut down as a non-admin result in a failure to shut down message. We are curious if there was an issue with our upgrade or if there is a change that requires an administrator to shut down Cache in 2017.2.

edit:

Operating System is Windows Server 2012 R2. We run Cache in a cluster using Windows Failover Cluster where we swing the drive from one machine to another when failing.
