What Object Script command can write KILLdes journal records?

I'm working on a task where I need to apply journal file records to another database. I can't use Journal.Restore class methods as I need to perform some data transformation, therefore I'm reading journal file record by record using %SYS.Journal.Record API.

It seems that there are only few journal records that I need to process, namely:

Type	TypeName
6	SET
7	KILL
8	KILLdes
9	ZKILL
10	RemoteSET
11	RemoteKILL
12	RemoteZKILL
14	BitSET

No problem, while I'm just curious: which COS command could provide KILLdes record? I've met it only once in the context like this:

```
KILLdes ^SYS("Task","TaskD",1006,"EmailOnError",1)
```

I can't imagine that Caché is smart enough to recognize the command series:

```
set tmp=^SYS("Task","TaskD",1006,"EmailOnError",1)
kill ^SYS("Task","TaskD",1006,"EmailOnError",1)
set ^SYS("Task","TaskD",1006,"EmailOnError",1)=tmp
```

as one KILLdes ^SYS("Task","TaskD",1006,"EmailOnError",1)`action.

It should be a command or an intrinsic function to perform it as a single statement; does anybody know it?
