How to splice a segment with a DTL? (in a BPL)

Hi,

I want to splice a PID segment returned from a query, so I can use it in a DTL:

```
<assign value='context.pidSegment' property='target.{PIDgrp.PID}' action='set' />
```

I need to set the value of 'context.pidSegment' to something I can use in the DTL objectsript expression

but I'm not sure what method (or property) to use to get the class EnsLib.HL7.Segment segment into a datatype that can be used in the DTL?

I've tried the following to no avail;

- context.K21response.GetSegmentAt("PIDgrp.PID")
- context.K21response.FindSegment("PIDgrp.PID")
- context.K21response.GetSegmentAt("PIDgrp.PID").RawContent
- context.K21response.FindSegment("PIDgrp.PID").RawContent

(using <assign> to set context.pidSegment)

What method should I use?

Kind regards,

Stephen
