How do I synchronize/update iKnow domain

I have iKnow domain with 1 source, 1 data and 1 metadata fields. Source is a table.

Let's say individual rows are immutable, but new rows are added after the domain is built.

How do I add them to domain?

In [%SYSTEM.iKnow](#) class `IndexTable` method is available:

```
classmethod IndexTable(pDomainName As %String, pTableName As %String, pIdField As %String, pGroupField As %String, pDataField As %String, pMetaFields As %List = "", pWhereClause As %String = "", pConfig As %String = "") as %Status
```

Assuming I have a table `App.Text` with fields:

- ID - primary key
- Text - text data
- Views - metadata (same name in table and domain)

And for domain, named `MyDomain` - how do I call this method? How do I match metadata?

```
set sc=##class(%SYSTEM.iKnow).IndexTable("MySomain", "App.Text", "ID", "ID", "Text", $lb("Views"), "ID > 100")
```
