[Intersystems 2017] Use the email alert request

Hello,

I used the operation : EnsLib.EMail.AlertOperation to send mail to handle error. However, I want to get more information about the error (session ID message, the date, the namespace... etc).

what is the best way to do it?

I tried to add informations in OnAlertRequest method as below but I need to change mail operation from all namespaces...

```
Class ExtranetPTL.Services.EnvoiMail.emailAlerte Extends EnsLib.EMail.AlertOperation
{

Method OnAlertRequest(pAlertRequest As Ens.AlertRequest, Output pResponse As Ens.Response) As %Status
  {
      If ..IncludeDetails {
          Set tSC = ..CreateEmailFromAlertRequest(pAlertRequest,.tMailMessage)
          If $$$ISERR(tSC) Quit tSC
      }
      Else {
          Set tMailMessage = ##class(%Net.MailMessage).%New()
          Set tMailMessage.Subject = "Ensemble alert from " _ ..InstanceName _ ":"_pAlertRequest.SourceConfigName
          Set tMailMessage.Charset = "UTF-8"
          If (pAlertRequest.AlertDestination '= "") {
              #; if the Ens.AlertRequest supplied an AlertDestination, then add it to the list of configured Recipients
              Set tSC=..Adapter.AddRecipients(tMailMessage, pAlertRequest.AlertDestination)  Quit:$$$ISERR(tSC) tSC
          }
          Set environement = "Environnement : PRD"_$CHAR(13)
          Set namespace = "Namespace : "_$Namespace_$CHAR(13)
          Set date = "Date/heure : "_$ZDATETIME($HOROLOG)_$CHAR(13)
          Set session = "Session : "_pAlertRequest.SessionId_" (http://localhost:57772/csp/svcptl/EnsPortal.VisualTrace.ze
          Set message = "Message : "_pAlertRequest.AlertText
          Set tSC = tMailMessage.TextData.Write(environement_namespace_date_session_message)
          Quit:$$$ISERR(tSC) tSC
      }
      Quit ..Adapter.SendMail(tMailMessage)
  }
 }
```
