Help with dynamic Xecute in curly brackets

Typically, I have time to review the documentation, which I'm sure is [here](#). However, I have a workaround (TEST1) but I was wondering if anyone could assist me in advising how I would need to adapt the curly brace snippet (TEST2) to provide the same result.

Thanks for any help you can provide.

```
TEST1(STATUS=1) K (STATUS)
 X "S MSG=$S(STATUS:""HELLO"", 1:""GOODBYE"")"

 W !,MSG
 Q

TEST2(STATUS=1) PUBLIC {
X "S MSG=$S(STATUS:""HELLO"", 1:""GOODBYE"")"

W !,MSG
}
```
