How to display a property containing html without encoding all special characters

I have a class thus:-

Class RMH.ClinDoc.Response.GetEPRDisplayResponse Extends Ens.Response [ProcedureBlock]

{

Property GetEPRDisplayResult As %XML.String;

}

The property GetEPRDisplayResult contains html content.

When I write out the property in a terminal, all the html special character content is encoded e.g. '<' is < '>' is > etc....

I want to display this html in a browser and have it render as normal.

So my question is how to I store html content in a cache object such that it renders correctly in a browser?

To make things more complicated this data comes into Healthshare as an xml payload and is correlated into an instance of the above class

Thanks

Regards Mike
