How to access the Header properties of a message in Code

I am trying to write a generic process that will take any incoming message but would like to know where it came from so in my code I would like to do something like this

```
If (Document.Source="some serviceorProcess").
```

Just to be clear in the route you get these features is there a way of accessing them in code

[#Business Process \(BPL\)](#) [#Object Data Model](#) [#ObjectScript](#) [#Caché](#)
