Question about /Info/FilterMembers

Hi everyone.

I have a cube with two dimensions, DimA and DimB, with the following structure:

DimA/H1/LevelA

DimA/H1/LevelC

DimB/H1/LevelB

DimB/H1/LevelC

LevelC is modeled in such way because its bound property (C) is group by properties A and B in transactional database, but A and B haven't relation.

I can use DeepSee REST API service /Info/FilterMembers/:datasource/:filterSpec specifying each dimension one filterSpec parameter and handle the results.

But, I would like to have the results for both dimension in only on service call.

Is that possible? I mean, calling /Info/FilterMembers/:datasource/:filterSpec with an array of filters on filterSpec parameter?

Thank you.
