Unable to export lookup tables (.LUT) and HL7 schemas (.HL7) directly via Atelier to commit in source control (GIT)

We have started playing around with Atelier, primarily to enable us to commit our existing Ensemble code within source control (GIT).

It seems Atelier works well with classes and routines however is unable to directly export lookup tables and HL7 schemas. Can someone confirm/validate this is the case? if so, when will this functionality be made available as it's absence is a deal breaker for us?

Lookup tables (.LUT) and HL7 schemas (.HL7) are more code and less configuration. They should be exported and kept in sync between Atelier and namespace much inline with how .cls files are handled. It is not practical to manually export / import these via Management portal every time code needs to be committed to source control.
