## Change all passwords in a system

This code snippet changes all passwords in a system to a specified string. The two literal strings at the beginning of the snippet can be adjusted to edit the system or password string. The class method "test" runs the code:

```
Class eduardlebedyuk.changePasswords Extends %RegisteredObject
{
    ClassMethod test()
    {
        set ns = $namespace
        zn "%SYS"
        set NewPass = "NewPassString"
        set rs=##Class(%ResultSet).%New("Security.Users:List")
        set st = rs.Execute()
        while rs.Next() { set st=$SYSTEM.Security.ChangePassword(rs.Get("Name"),NewPass)}
        zn ns
    }
}
```
