About the synchronous encoding of Atelier
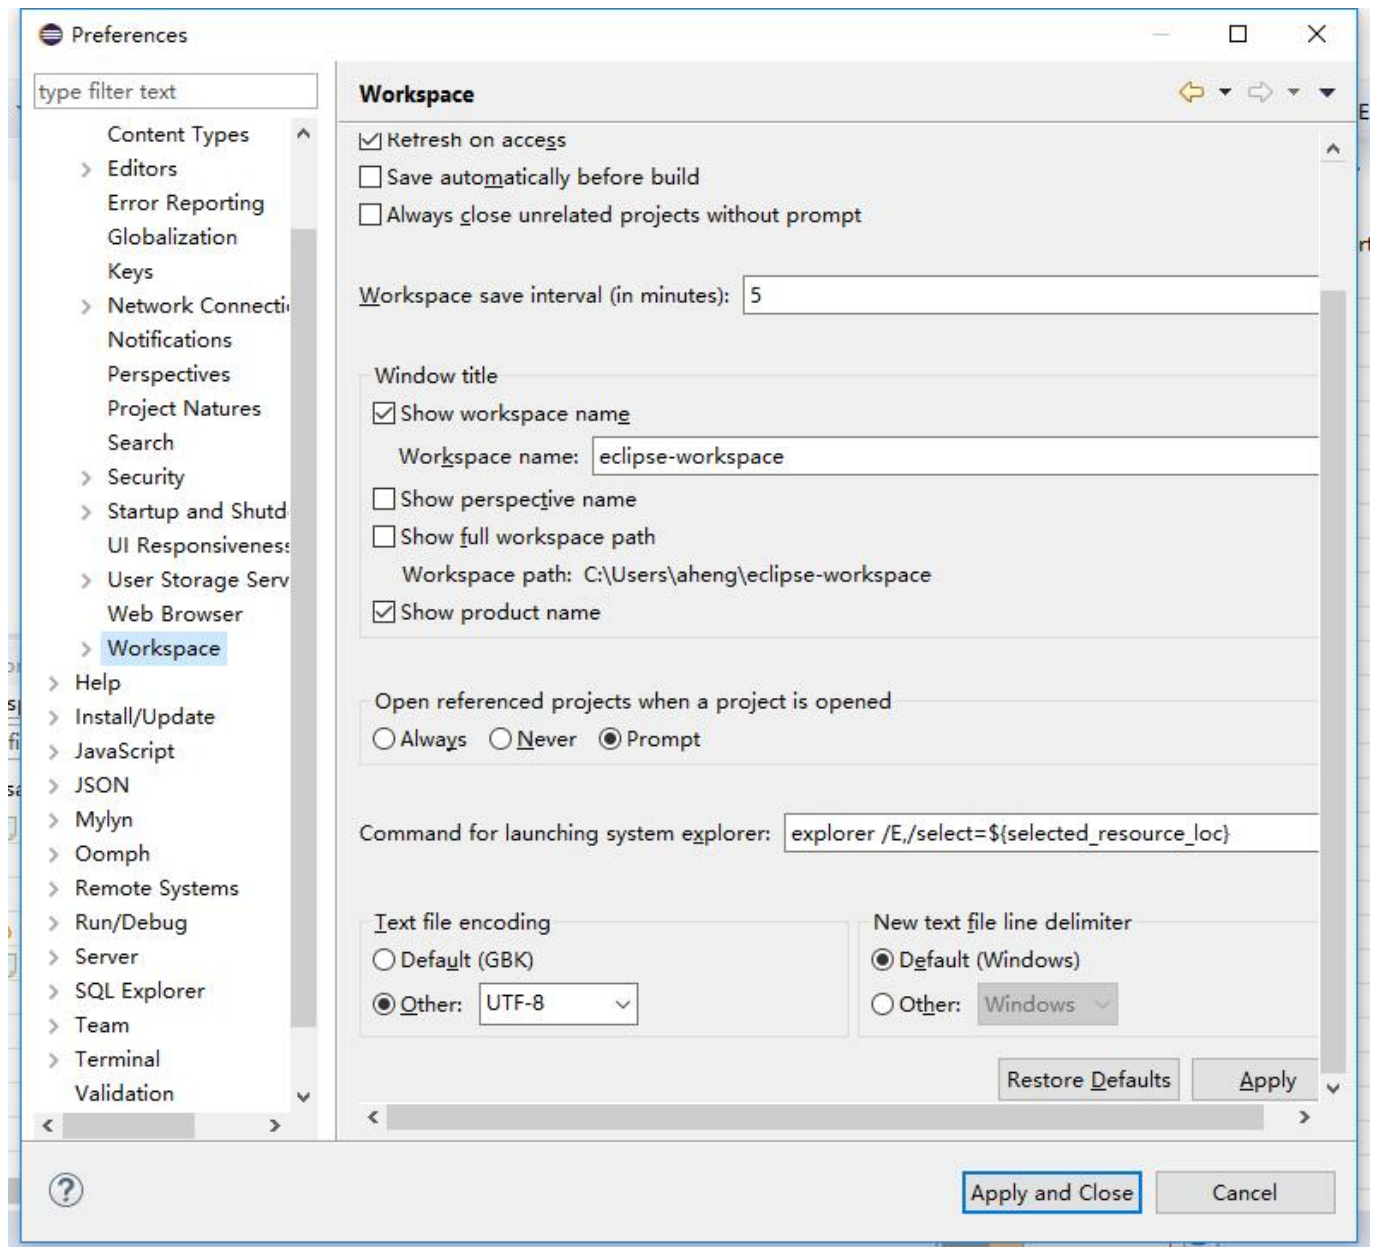

Hello,every body.

I am having a problem when using atelier. I found that the web front-end related files (such as csp, css, js, etc.) will change in format when they are synced to the server.

For example:

The original format of the js file may be UTF-8. However, when I edited and saved in atelier, the file version format on the server became ANSI. I tried to configure the environment in eclipse, but it doesn't seem to work.

E.g:

Because the file contains Chinese characters, this has a significant impact on the actual use.

So, what should I do to solve this problem. Thank you in advance.
