OBX 5 and CRLF

Hello,

I have some issues trying to store a base64 encoded stream into the obx:5 segment.

I'm using the StoreFieldStreamBase64 method in my business process to store the stream into the segment.

I'm sending the hl7 message containing my stream to an ensemble business operation (EnsLib.HL7.Operation.FileOperation) to write the message on disk.

When i'm reading it with an ensemble business service, it can't parse the stream because it contains multiple CRLF.

Why is my business operation splitting my stream into multiple newlines ?

Ensemble ver : 2016.2
