How do I process queryString parameters in a HttpGet Request in a %CSP.REST page?

So by queryString I mean name-value pairs passed in as part of the URL. Currently my service works when called like this

```
http://{{SERVER}}:{{PORT}}/bsolabs/api/codemangement/testcode/BIO/CRP
```

What would I need to change so I can call it like this?

```
http://{{SERVER}}:{{PORT}}
```

```
/bsolabs/api/codemangement/testcode?Discipline=BIO&TestCode=CRP
```
