HTTP Request - InsertParam method

Hello Experts,

I have a silly question of using InsertParam method and usage. I understand it is name value pair. I am using GET method to send a url and to get the details from server. URL has multiparameter

URL - api/Identifier/Image/?Verify.EDD={EDD}&Verify.Ethnicity={ETHNICITY}

I have used the URL in a method and called that method directly in the business operation. I am using Insertparam method -

do httpRequest.InsertParam("EDD",..Data.Verify.EDD)
do httpRequest.InsertParam("ETHNICITY",..Data.Verify.Ethnicity)

where httpRequest is an object of %Net.HttpRequest class

Question is how will these parameters can be called in the URL? Please advice

Is there any other ways we can do the same things? Ultimately, i want to pass these parameters in the url

#API #Beginner #Object Data Model #ObjectScript #Ensemble
