Failed to run a Docker container

I followed the [First Look](#) instructions and tried to run a Docker container with the below command:

```
> docker run --name iris --detach --publish 52773:52773 --volume  
/Users/docker:/external --env ICM_SENTINEL_DIR=/external iris:latest --key  
/external/iris.key --before "/usr/irissys/dev/Cloud/ICM/changePassword.sh  
/external/password.txt"
```

It returned with a container ID and an error message:

```
docker: Error response from daemon: OCI runtime create failed:  
container_linux.go:348: starting container process caused "exec: \"/iris-main\  
permission denied": unknown.
```

"docker ps -a" shows that the status of this container is "Created", not "Up". How can I resolve this "permission denied" issue?
